

Setting Up and Using PocketSmart AI for Budget Planning

What You'll Learn

- How to configure PocketSmart AI with a Google Gemini API key and run it locally in Visual Studio Code
- How to register an account and sign in to the PocketSmart AI web app
- How to use the Home, Party, and Jewelry planners to generate AI-powered budget recommendations
- How to browse suggested products on external retail sites like IKEA, Amazon, and Flipkart
- How to navigate the dashboard, review your plan history, and log out securely

Introduction

This guide walks you through setting up PocketSmart AI — a budget-planning tool powered by Google's Gemini AI — and using its three planners (Home, Party, and Jewelry) to generate budget-aware recommendations. It's intended for anyone installing PocketSmart AI for the first time or learning how to use its planning features day to day.

Prerequisites

Before you begin, make sure you have:

- Visual Studio Code installed, with the [PocketSmartAI_FIXED_VSCode](#) project folder available
- A Python virtual environment already set up in the project ([venv](#) folder)
- A Google account to access Google AI Studio and generate an API key
- A web browser for accessing Google AI Studio and the PocketSmart AI web app
